## BOOK REVIEWS

If you wish to order or require further information regarding the titles reviewed here, please write to or telephone the BMJ Bookshop, PO Box 295, London WC1H 9JR. Tel 0171 383 6244. Fax 0171 383 6662. Books are supplied post free in the UK and for BFPO addresses. Overseas customers should add 15% for postage and packing. Payment can be made by cheque in sterling drawn on a UK bank or by credit card (Mastercard, Visa, or American Express) stating card number, expiry date, and full name. (The price and availability are occasionally subject to revision by the Publishers.)

**Familial Cancer Management.** Editors W Weber, J J Mulvihill, S A Narod. (Pp 246; £99.00.) UK: CRC Press. 1996. ISBN 0-849-34782-3.

This relatively expensive book is an interesting addition to the expanding body of publications dealing with familial predisposition to cancer. The subject is broad and covered fairly comprehensively. However, the book left me with the impression of a collection of papers written in isolation by experts in the same broad field. This leads to some repetition of basic themes from chapter to chapter. I was unsure at whom the book is aimed. Read as a book from cover to cover the contents would give the reader a good idea of the controversies and variation in clinical practice which is the inevitable result of the still limited clinical research data available in much of this field. The subject matter, of course, leaves ample room for individual opinion as it is an evolving field. Although perhaps not the primary aim of the book, the differences in opinions and the differences in clinical practice in different health care systems came across well by reading the entire book. However, I felt using this as a reference text for clinical practice would be difficult. The book led me to reflect once more on the differences between health care in the different countries.

Certainly there is a wealth of information here with some excellent chapters and some

perhaps less accessible chapters. Many of the contributors balance appropriately their own protocols for best clinical practice in their setting with contrary views, such as the unproven benefit of many of the advocated screening activities provoked by identification of a cancer predisposition in a person. In some situations where the natural history is understood and the screening strategy is proven to reduce mortality (such as for familial adenomatous polyposis), screening strategies and prophylactic surgery are generally agreed and accepted. In, for example, genetic predisposition to breast cancer the case remains to be proven for either screening or prophylactic surgery. More emphasis on the need for collaborative studies to address some of these issues would redress the balance.

There are chapters covering some basic laboratory techniques in which the genetic terminology would present difficulties for a reader unfamiliar with basic molecular biology. There are some good balanced overview chapters. However, since there is no apparent specific target audience and the arrangement of the information does not lend itself to use as a reference text, as the field moves on and expands even further, a subsequent edition may need a slightly different approach.

There are some interesting and wide ranging chapters, for example, on the legal and ethical issues raised by the discovery of cancer predisposition genes, which add interest to a wide range of potential readers. Although this book may be a useful addition to the departmental library, the high cost and the layout of the book would make me hesitate to recommend it for personal use.

DIANA M ECCLES

**Etiology and Pathogenesis of Down Syndrome.** Progress in Clinical and Biological Research Volume 393. Editors Charles J Epstein *et al.* (Pp 260; £85.00.) UK: Wiley-Liss. 1995. ISBN 0-471-12317-X.

This book is a typical product of the proceedings of a meeting that was held in Charleston, South Carolina, in April 1994 and sponsored by the National Down Syndrome Society. The theme of the meeting was to discuss the latest developments on the aetiology and pathogenesis of Down syndrome, which is a compilation of phenotypes resulting from three copies (instead of two) of genes that map to human chromosome 21. The field of aneuploidy and gene dosage is fascinating, challenging, and ready for discoveries. The exploration of the genome of chromosome 21 will undoubtedly provide some answers to the aetiology and pathophysiology of certain phenotypes. However, the full understanding of the gene to phenotype process will probably come a long time after the cloning and characterisation of all chromosome 21 genes.

The book contains chapters from numerous authors or groups of authors that vary widely in topic and quality. Some of the chapters describe the results of many years of investigations and the data could well be part of textbook discussions. Other chapters, in particular those that describe mapping infor-

mation, are outdated because of the extensive amount of new information that accumulates rapidly. The chapter on the cognitive abilities in Down syndrome is an important addition to this book and deals with a topic that the methodological biologist does not usually find in his/her publications. The methodological chapters provide a nice account of approaches to studying the effects of trisomy in model organisms or mammalian cells.

The book is interesting to those who are students of aneuploidy and gene imbalance. It is also of interest to neurologists, geneticists, biologists, and behavioural paediatricians. I particularly liked the closing chapter (epilogue) that contained a personal view (that of Dr C Epstein) of how far we have come and how far we can reasonably expect to go. I fully agree with his predictive remarks. It is my impression that after the understanding of the majority of monogenic disorders, trisomy 21 will again come to a prominent position in the stage of problems that the human biologist would tackle with the tools of whole genome analysis.

STYLIANOS E ANTONARAKIS

**Starting and Sustaining Genetic Support Groups.** Joan O Weiss, Jayne S Mackta. (Pp 153; £33.00 hb, £15.50 pb.) Baltimore: Johns Hopkins University Press. 1996. ISBN 0-8018-5264-1.

This book aims to provide practical guidance to lay people or genetics professionals on starting a genetic support group or working with an existing one. A key theme is the importance of partnership between professionals and families based on mutual respect and the effective use of their different contributions. Weiss is the director of the US Alliance of Genetic Support Groups, and the authors take a realistic and practical approach to the subject, with an understanding of both the potential and the pitfalls.

An overview is given of the benefits and limitations of genetic support groups. The authors stress their value in breaking down isolation, particularly after diagnosis, and in enabling communication with people who have gone through similar experiences. They also emphasise that groups cannot solve all problems, and the importance of referral to professionals when needed. They examine common difficulties and conflicts, which can limit a group's ability to give support, and how to deal with these.

There is practical advice on how to organise a genetic support group. This covers getting started, setting goals, finding people, assessing people's need (with a useful checklist), developing group leadership, and avoiding burnout and other problems. The book gives guidance on developing peer support; the role of professionals in working with the group; communication and publications; organising meetings and support sessions; fundraising; and taking part in research.

While written from a US perspective, this clearly written basic guide is a useful resource for anyone involved in setting up or working with a genetic support group. It includes a comprehensive listing of US genetic support groups, genetic services, and other resources.

JANE BELMAN

## Notice to Contributors

The *Journal Medical Genetics* publishes original research relevant to medical genetics, along with reviews, annotations, and editorials on important and topical subjects. It also acts as a forum for discussion, debate, and information exchange through its Letters to the Editor column, conference reports, and notices. The journal particularly encourages submissions on the molecular basis of human disease, the clinical manifestations of genetic disorders, applications of molecular genetics to medical practice, and the systematic evaluation of such applications. The journal attempts to handle the review process and publication as expeditiously as possible. Accelerated publication is available where warranted by scientific urgency and recommended by reviewers. Submissions are accepted only on the understanding that they have not been and will not be published elsewhere, and are subject to editorial revision. They should be sent to:

**Professor Martin Bobrow**  
**Editor, Journal of Medical Genetics**  
**Department of Medical Genetics**  
**Box 238, Level 3, Laboratories Block**  
**Addenbrooke's Hospital**  
**Cambridge CB2 2QQ, UK**  
**Tel: +44 (0)1223 331190**  
**Fax: +44 (0)1223 331206**  
**e-mail 101573.2243@compuserve.com**

*Manuscripts from North America may be sent directly to the North American Editor Manuscripts that do not conform to the following instructions may be returned for modification before being reviewed.*

- **All submissions** must be typewritten on one side of the paper only, using double spacing and ample margins. A total of three copies of articles and letters should be supplied, together with three copies of any tables or figures. The pages should be numbered. All abbreviations must be defined.

- Manuscripts must be accompanied by:

- **Covering Letter** Each author must sign the covering letter as evidence of consent to publication and all authors will be required to transfer copyright of their articles to the journal before publication.

- **Consent** All identifiable photographs of patients should be accompanied by written permission for use. Pedigrees, particularly those containing information on people who may be presymptomatic carriers of later onset disease, should, as far as possible, be anonymised.

- **Ethical approval** The critical assessment of submitted papers will include ethical considerations; documentary evidence (where relevant) of ethical committee review and approval will be very helpful.

- **Title sheet** stating the title of the paper, as well as a short title, the authors, their departments and institutions, and the name and postal address (+ Tel/Fax numbers) of the corresponding author.

- **Referees** Authors are welcome to suggest people particularly competent to act as referees; although the journal may not use the suggested referees on that occasion, they will be added to our database. Conversely, authors' wishes on those whom they would prefer not to referee their work will be respected.

### Categories of contributions

**1. Original papers** represent a substantial body of laboratory or clinical work. The study should be presented in sections, namely:

- **Abstract** No more than 250 words, summarising the problem being considered in the study, how the study was performed, the salient results and the principal conclusions of the study. *Structured abstracts* (in the format used by eg the *British Medical Journal* and the *Journal of the American Medical Association*) have been shown to be more useful to readers, and their use is encouraged wherever possible.

- **Key words** (maximum of four) These should be given beneath the abstract.

- **Introduction** Brief description of the background that led to the study.

- **Methods** Details relevant to the conduct of the study. Statistical methods should be clearly explained at the end of this section.

- **Results** Work should be reported in SI units. Undue repetition in text and tables should be avoided. Comment on validity and significance of results is appropriate but broader discussion of their implications should be placed in the next section.

- **Discussion** The nature and findings of the study are placed in context of other relevant, published data. Subheadings that aid clarity of presentation are encouraged.

- **Data access** Reference should be made to availability of detailed data, either through public databases or otherwise, and to availability of materials used for reported investigations. It is generally expected that genomic and similar data should be lodged in appropriate public databases at or before the time of publication. Authors are encouraged to make DNA or cell lines available to other workers.

- **Acknowledgments and affiliations** People with direct involvement in the study but not included in authorship may be acknowledged. The source of financial support and industry affiliations of all those involved should be stated.

- **References** In accordance with the Vancouver agreement these are cited by the numerical system and listed in the order cited in the text, not in alphabetical order by authors' names. (In the text, the reference number should be given between square brackets on the line, not superscript.) All authors should be listed. Journal titles are abbreviated in accordance with the style of Index Medicus. See references in the journal.

- **Figures** should be kept to a minimum and should be numbered consecutively in Arabic numerals. Legends should be typed on a separate sheet.

- **Tables** should not be included in the body of the text but should be typed on separate pages and numbered with Arabic numerals. A legend should be provided above the table.

- **Illustrations** Colour illustrations can be accepted; however, authors are asked to pay part of the cost.

- **Nomenclature** Current standard international nomenclature should be adhered to.

**Chromosomes:** *ISCN 1995. An International System for Human Cytogenetic Nomenclature*, Mitelman F (ed); S Karger, Basel, 1995

**Genes:** **McAlpine P. In: The Genetics Nomenclature Guide (Human).** *Trends in Genetics Supplement*, March 1995. For latest references, instructions, and list of approved symbols see URL <http://www.gene.ucl.ac.uk/nomenclature/> (or contact [nome@galton.ucl.ac.uk](mailto:nome@galton.ucl.ac.uk))

**Enzymes:** Enzyme nomenclature: recommendations of the nomenclature committee of the International Union of Biochemistry. New York: Academic Press, 1992. Information also available on URL <http://expasy.hcuge.ch/sprot/enzyme.html>

### 2. Short reports

A brief communication presenting laboratory or clinical work, collected case reports, or single case reports. Reports of single mutations at loci which have already been documented will be published only if they are of unusual clinical or biological interest. The format can be identical to Original papers (see above) but in many circumstances the main body of the text may be better presented without division into sections. Short reports are intended to occupy no more than 2 printed pages; equivalent to about 1000 words, 2 tables/figures, and about 15 references. Brevity and clarity are always likely to enhance the chance of a manuscript being accepted for publication.

### 3. Review articles

Authors are welcome to discuss possible topics for review directly with the Editor.

### 4. Syndrome of the month

These reviews are commissioned by special editors, to whom suggestions can be addressed.

### 5. Hypothesis articles

Contributions which present an interesting theory, discussed in relation to published data, are welcome.

### 6. Letters

These are welcome on any relevant topic and will be published rapidly. Those relating to or responding to previously published items in the journal will be shown to those authors, where appropriate.

### Proofs

One page proof will be sent to the author submitting the paper and alterations on the proof, apart from printer's errors, are not permitted. Reprints may be ordered when the proof is returned.

**Desk version** Manuscripts are published directly from disk. Final revised versions of papers will therefore be needed as hard copy and or disk. Instructions will be sent to authors on invitation to revise or or acceptance.

A complimentary copy of the journal will be sent to the corresponding author on publication.
