in families with IP may, however, be fruitful in the search for the gene.

BOOK REVIEWS

If you wish to order or require further information regarding the titles reviewed here, please write to or telephone the BMJ Bookshop, PO Box 295, London WC1H 9JR. Tel 0171 383 6244. Fax 0171 383 6662. Books are supplied post free in the UK and for BFPO addresses. Overseas customers should add 15% for postage and packing. Payment can be made by cheque in sterling drawn on a UK bank or by credit card (Mastercard, Visa, or American Express) stating card number, expiry date, and full name. (The price and availability are occasionally subject to revision by the Publishers.)

The A-Z Reference Book of Syndromes and Inherited Disorders. 2nd ed. Patricia Gilbert. (Pp 378; £15.99 pb.) London: Chapman & Hall. 1995. ISBN 0-412-64120-8.

The diagnosis of a rare condition in a child understandably raises many questions for that child's parents and relatives. Such queries are usually posed to the paediatrician or GP caring for the child. However, there are a wide range of health professionals involved in the care of the child who need information about a condition, both for themselves, and to answer the questions inevitably also posed to them. The problems of "how did it happen?", "can you treat it?", "will it happen again?", and many more are well addressed in this reference book.

Dr Gilbert has produced an expanded second edition of her book, designed to inform

health professionals and families after a syndrome diagnosis has been made. It has been specifically written in non-technical language, aimed at a general readership, who may not have a broad medical knowledge. Twenty new syndromes have been included at the request of readers, giving a total of 90 conditions, the majority of which are genetic. This is assisted by a clear appendix containing a good review of basic genetics by Peter Farndon. A useful glossary is also included. There is an alphabetical listing of each syndrome, with 1000 words or more per entry describing its incidence, history, causation, characteristics, management, and future developments. The descriptions show that Dr Gilbert has had extensive first hand experience in the care and management of children with rare disorders. The inclusion of the addresses of support group associations, Contact-A-Family, and the UK clinical genetics centres also shows her understanding of parents' needs. The language used for the most part is clear and simple to understand.

No such book could aim to cover all the rare syndromes. The author states that she can only cover a small number of syndromes. Her book is in fact an A-W of syndromes, although she could have made it an A-Z by including Zellweger's syndrome! There are also a few minor problems, such as the absence of any discussion of renal biopsy in Alport's syndrome, the omission of epilepsy as a complication of neurofibromatosis, and a rather unclear distinction between Finnish nephrotic syndrome and the many other causes of nephrotic syndrome. There is also no reference to the finding of an expanded triplet repeat causing fragile X syndrome, explaining the unusual inheritance. The index contains a list of signs and symptoms found in different syndromes, similar to that seen in Gorlin's *Syndromes of the Head and Neck*, ostensibly as an aid to diagnosis. In fact, this volume is better used as a reference once a diagnosis has already been made. The lack of photographs also makes this volume more suited to the role of a lay reference work, rather than a diagnostic aid.

Overall, this is an excellent reference book for a wide range of health and educational professionals. It provides clear clinical information, and can give a quick snapshot of a condition for many people involved in the care of children with rare disorders.

ANDREW GREEN

Maternal Genetic Disease. Edited by N B Isada, A Drugan, M P Johnson, M I Evans. (Pp 272; £65.95.) Stamford, Connecticut: Appleton and Lange. 1994. ISBN 0-8385-6164-0.

People who advise pregnant women need to keep up with developments in genetics. Parents always want to know the risks of passing a condition to their children and whether anything can be done to reduce these. Often the first person they ask is their obstetrician or midwife. This book, edited by a distinguished team from the United States and Israel, aims to provide the information required. It has some good features but these are outweighed by many faults.

The book opens with six chapters on general aspects of genetic diseases, including specifically preconception counselling, chromosomal problems, and mental retardation.

These deal with these problems in a similar way to most textbooks of genetics, albeit very briefly and with some important omissions. The book then changes character, and in the remaining 12 chapters a range of authors each tackle the genetic aspects of a specific maternal pregnancy problem, including the main medical problems that occur in pregnancy, renal, cardiac, haematological, neurological, and psychiatric disease, etc. This is a nice idea since, for generalists caring for pregnant women, these multifactorial conditions are much more common than the single gene defects on which most traditional genetic texts concentrate, and some chapters are very successful. However, for some diseases, once it has been stated that the inheritance is multifactorial, and the empirical recurrence risk given, there is little more to say. Unfortunately, this has not deterred contributors from padding out their chapters with platitudes, irrelevances, and repetitions, and the whole book cries out for stronger editing. The arrangement also leads to oddities. For example, cystic fibrosis (CF) appears only in chapters on anaesthesia and gastrointestinal disorders. The reason for the former appears to be that having written about malignant hyperpyrexia and succinylcholine sensitivity, the author needed a couple more pages to make a full chapter. The description of CF in the gastrointestinal chapter is concerned almost entirely with the important but rare problem of pregnancy in an affected woman. It is a quite inadequate guide to the day to day problems surrounding CF counselling and prenatal diagnosis for normal women with or without a family history.

There are many other omissions and imbalances. Some are serious and others simply rather strange. For example, myotonic dystrophy gets only five lines in one of the introductory chapters while multiple sclerosis gets 10 pages later on. It is unacceptable for a large genetics text in 1996 to omit any explanation of the whole area of triplet repeat sequences and genomic imprinting. Less serious, but still curious given the relative weight allocated to common multifactorial diseases, is the omission from a three page description of pre-eclampsia of any mention of the familial pattern of this disease. Readers will not learn that many experts even believe, albeit wrongly in my view, that this fascinating and common condition might be inherited in simple mendelian fashion, and that a number of groups are already doing gene linkage studies. They should be told.

This book bears all the hallmarks of being dashed off by busy authors and editors with more important calls on their time. I cannot recommend it.

J G THORNTON

The Molecular Biology and Pathology of Elastic Tissues. Ciba Foundation Symposium 192. (Pp 361; £49.95.) London: Wiley. 1995. ISBN 0-471-95718-6.

This book contains the published proceedings of an excellent Ciba Symposium on the molecular biology and pathology of elastic tissues held in Kenya in 1994. As one expects of Ciba Symposium proceedings, the book is beautifully produced and very portable. Furthermore, it has been published within less than 12 months.

North American dominance in the field is very evident with 72% of the chapters and a

similar proportion of the participants originating from either the USA or Canada.

Here is an in depth coverage of the entire field of elastic tissue biology with state of the art information on topics such as biophysics, ultrastructure, elastin gene organisation, modifying enzymes, transgenic mice with elastin deletions, and the microfibrillar protein fibrillin 1. Coverage is also given to elastin regulation, histological changes in hypertension, and tumour biology. The range of topics mirrors most of those recently addressed in the 1995 Gordon Conference on the same topic. This book, of course, is available to a very wide audience whereas the Gordon Conferences, by their very nature, have a very limited audience.

Two important additions would have made this book even more valuable to an even wider audience. Firstly, a chapter on elastin related diseases would have been extremely valuable. While these are mentioned at various places throughout the book, the molecular pathology of disorders such as Williams syndrome, supravalvular aortic stenosis, cutis laxa, Marfan syndrome, PXE, Buschke-Ollendorf syndrome, aortic aneurysms, emphysema, etc, would have been a very valuable focus. After all, the first Williams mutations were described in 1993 and Marfan syndrome analyses have exploded since the gene sequence was published in 1991. Secondly, it would have been useful to have had a separate chapter on microfibrillar components other than lysyl oxidase and fibrillin. Microfibrils are important components of elastic fibres and include proteins such as MAGP, MFAP1, collagen VI, etc, in some of which the gene organisation resembles the fibrillin.

Nevertheless, the book will be of substantial interest to basic scientists interested in the field of connective tissue biology and also contains much interesting information for clinicians researching into connective tissue biology. Those with specific syndromic interests, however, are perhaps less well catered for, but the book is certainly a valuable addition to departmental libraries and large medical libraries should buy a copy.

F M POPE

Genetics and You. John F Jackson. (Pp 92; \$9.50 pb.) USA: The Humana Press. 1995. ISBN 0-896-03330-9.

The aim of this short book is "to provide basic information about genetic disorders in a useful form for those who have no special training in genetics". Unfortunately, it fails to do this, giving genetic information in dry, technical terms and failing to address the wider, relevant issues. The starting point is medicine, rather than people's lives.

I will give some examples which speak for themselves. The chapter on prenatal diagnosis fails to address the difference between screening and diagnostic tests, the meaning of positive and negative results, or the psychological issues of anxiety and false reassurance. We are told: "The very slight risk of complications for mother and fetus from CVS is slightly higher than for amniocentesis. Technical error is higher for CVS". We are not told what these risks are nor what their implications are. But we are told: "There is probably a higher risk for Rh sensitisation by CVS, requiring use of Rho GAM injections for R-negative mothers". Only the term CVS is explained.

Carrier risk is explained: "The carrier risk for an apparently normal sibling of an affected person married to a nonrelative becomes 2/3, times the population carrier rate for the spouse, times one in four for an affected child if both parents are carriers. For CF, for example, the risk would be $2/3 \times 1/5 \times 1/4 = 1/150$, or in card cutting terms: one ace of hearts in three decks of cards."

The chapter on the new genetics starts with RFLPs and PCRs and goes on to explain why genetics is relevant to organ transplantation: "There is a series of genes lined up on chromosome 6 called the major histocompatibility complex (MHC) or simply the HLA region. There are separate genes at five loci, with an enormous number of possibilities. The HLA-A locus has at least 20 different genes, and the B locus has more than 40. There is an additional series of genes at the C, D, and DR loci." The issues of gene transfer and cloning are equally obscure: "Sometimes it is harmful, as in the transfer of a gene from animal to virus to make an

oncogene capable of causing cancer. On the other hand, the entry of a single-cellular organism into the cells of higher organisms during evolution produced the mitochondrion", and "The cloning of a human analogous to that of frogs could be possible down the road."

Social and ethical issues are hardly referred to: "Heated debate has resulted from screening programs in the past and much has been learned". We are not told what the debate has been about nor what has been learned.

I make no apology for giving these quotes, the product of a clinical geneticist of 30 years' experience trying to communicate to the non-geneticist. While this review is unlikely to encourage people to buy this book, I hope it will encourage them to think about how we can better achieve the increasingly important task of communicating about genetic issues to non-geneticists. This is a multidisciplinary task, and would benefit from the expertise of those involved in the social and behavioural sciences, the public understanding of science, developing educational curricula, as well as communications using computer software.
