

London After Tomlinson

Reorganising Big City Medicine

Health services in many big cities in Britain and elsewhere, are no longer appropriate to serve populations that have moved out to the suburbs. Commissioned by the Government to provide some answers to London's health care problems, the Tomlinson report raises as many questions

■ What are the implications of its proposals for the future of health care in London and other big cities?

■ How are the substantial improvements in primary and community health care to be brought about?

■ What support is needed for teaching and research?

In *London After Tomlinson* experts look at the issues raised by the report and suggest solutions. Whatever the decisions made for London, it is clear that the problems are not unique to London but shared by many other large cities both in the United Kingdom and in other developed countries.

Duchenne Muscular Dystrophy

ALAN E. H. EMERY

'the author has been able to transfer his enormous experience into something readable and relevant...this beautifully produced book fulfils a need...anyone who has to care for these children should read it'

British Medical Journal

This second edition of this highly acclaimed monograph is the only text currently available which considers Duchenne Muscular Dystrophy in such detail. Emery draws on his extensive clinical experience and scientific knowledge to critically evaluate the extensive literature, incorporating the most up to date findings in molecular genetics and reviewing their significance for the busy clinician. This volume presents a comprehensive account of the clinical features of the disorder, its management and treatment, and reviews the possibilities of treatment and prevention. It is indispensable for all those associated with genetic and neuromuscular disorders.

The Genetic Basis of Common Disease

Edited by RICHARD A. KING,

JEROME I. ROITTER, and ARNO G. MOTULSKY

The Genetic Basis of Common Disease is a unique and comprehensive resource for human geneticists and physicians concerned with the genetic causes of diseases routinely seen in research, clinical practice, and genetic counselling. Each of the 46 chapters covers a particular disease, describes the genetic factors involved, and defines the relevant biochemical, immunological, and physiological markers. This is the only book to provide authoritative contributions which focus on common diseases and cover all those frequently encountered by the clinician.
