

# Automated Mutation Detection

*Screen.* Use PCR-based methods such as SSCP, shown here, to screen for differences between mutant (left) and wild-type (right) genes.

*Sequence.* Rapidly home in on heterozygotes (bottom sequence) with specialized sequence analysis software.

## Imagine how productive you'd be with one system that can do both.

We've automated the entire mutation detection process—from sample preparation to heterozygote calling. So you don't have to

imagine new levels of productivity. You can achieve them. Easily.

By combining screening techniques

with comparative sequencing, our system can help you increase the throughput and speed of your research projects. You'll have the flexibility you need for more productive gene characterization.

The foundation of this versatile and accurate system is our proven Model 373 electrophoresis hardware. You also get all the specialized tools you need for complex data analysis.

New Sequence Navigator™ software gives you accurate, high-resolution sequence comparisons. It cleans up base-calling data, automatically aligns sequences, and flags heterozygotes.

With GENESCAN™ fragment analysis software and the Gene-Amp PCR process you can use popular PCR-based screening techniques, such as single-strand conformational polymorphism (SSCP) and heteroduplex analysis.

And PRISM™ DNA sequencing and PCR analysis reagents streamline sample preparation. With our standard four-dye fluorescence technology, this

system lets you run in-lane controls for accuracy and throughput other methods can't match.

Now there's a system that expands your experimental options instead of limiting them. Imagine the productivity. Imagine the value.
